114南一第=次模考#17

直角 $\triangle ABC$, $\angle ABC = 90^\circ$, $\cos A = \frac{7}{8}$, D 點在斜邊 $\overline{AC}$ 上, $\overline{AD} = 6$, $\cos \angle ABD = \frac{11}{16}$, 則

$\overline{AC}$ 的長度為 $\frac{\textcircled{17-1} \textcircled{17-2}}{\textcircled{17-3}}$ (化為最簡分數)

<Sol>

$$\because \cos A = \frac{7}{8} \therefore \sin A = \frac{\sqrt{15}}{8}$$

$$\because \cos \angle ABD = \frac{11}{16} \therefore \sin \angle ABD = \frac{\sqrt{135}}{16} = \frac{3\sqrt{15}}{16}$$

$$\text{在 } \triangle ABD \text{ 中, } \frac{\overline{BD}}{\sin A} = \frac{6}{\sin \angle ABD}$$

$$\Rightarrow \overline{BD} = \frac{6}{\frac{3\sqrt{15}}{16}} \times \frac{\sqrt{15}}{8} = \frac{96}{3\sqrt{15}} \times \frac{\sqrt{15}}{8} = 4$$

$$\because \cos A = \frac{7}{8} \therefore \text{設 } \overline{AC} = 8k, \overline{AB} = 7k$$

$$\because \cos \angle ABD = \frac{11}{16} = \frac{(7k)^2 + 4^2 - 6^2}{2 \cdot 7k \cdot 4}$$

$$\Rightarrow \frac{11}{16} = \frac{49k^2 - 20}{75k} \Rightarrow 98k^2 - 40 = 77k$$

$$\Rightarrow 48k^2 - 77k - 40 = 0 \Rightarrow (7k - 8)(14k + 5) = 0$$

$$\Rightarrow k = \frac{8}{7} \vee -\frac{5}{14}$$

$$\therefore \overline{AC} = 8k = 8 \cdot \frac{8}{7} = \frac{64}{7} \#$$
